

Installation:

Please follow the directions in the “Installation” PDF included with the download.

Delta Blues Ac Slide Guitar allows you to create realistic blues tracks using 6 layers that are controllable by velocity, key-switches, or both. Everything is on one panel for easy access.

1 Preset Selection

Here you'll find some preset configurations. There are no on-board user memory presets, since you can easily save your edited instrument under a new name, and all your settings will be saved. Also, if you're working from within a DAW, your changes will be saved with your project.

2 Four buttons that activate special features:

VIB adds an automatic vibrato that frees up your left hand for more important things- like key-switches and drinking coffee.

12 STR turns Delta Blues into a 12-string guitar

RR Short for “Round Robin”, which automatically switches between 2 sample sets (using adjacent samples) so you're not hearing the same sample on the same note every time.

AMP turns on amplifier and cabinet effects. There are no controls available for the effects, but you can use Kontakt's Wrench and edit all you like!

3 The “Tweak” panel.

Here you can edit the volume level, low velocity limit, high velocity limit, and key-switch for each layer. There are also controls for the Release samples and Finger Noise samples. Setting these to 0 turns them off.
